1 Evaluate the following integrals by Integration by Parts

1.1  $\int x(\tan^{-1}x)dx$

Solution

Let,  $u = x$

$$v = \tan^{-1}x$$

$$du = x \, dx$$

$$dv = \frac{1}{x^2 + 1} dx$$

$$u = \frac{x^2}{2}$$

According to integration by parts formula, we know that,

$$\int u \, v \, dx = u \int v \, dx - \int \frac{du}{dx} (\int v \, dx) dx$$

$$\Rightarrow \int u \, v \, dx = \frac{x^2}{2} \int \tan^{-1}x - \int \frac{x^2}{2(x^2+1)}$$

$$\Rightarrow \int u \, v \, dx = \frac{x^2}{2} \int \tan^{-1}x - \frac{1}{2} \int (1 - \frac{x^2}{x^2+1}) dx$$

$$\Rightarrow \int u \, v \, dx = \frac{x^2}{2} \int \tan^{-1}x - \frac{1}{2} \int 1 \, dx + \frac{1}{2} \int (\frac{1}{x^2+1}) dx$$

$$\Rightarrow \int u \, v \, dx = \frac{x^2}{2} \int \tan^{-1}(x) - \frac{x}{2} + \frac{1}{2} \tan^{-1}(x) + c \quad \left[ \because \frac{1}{x^2+1} = \tan^{-1}(x) \right]$$

$$\therefore \int u \, v \, dx = \frac{1}{2}((x^2 + 1)\tan^{-1}(x) - x + c) \quad [answer]$$

$$1.2 \quad \int \sqrt{x} \ln \sqrt{x} dx$$

Let,

$$u = \ln(x) \quad v = \sqrt{x}$$

$$du = \frac{1}{x} dx \quad v = \frac{2x^{\frac{3}{2}}}{3} dx$$

According to integration by parts formula, we know that,

$$\int u v dx = u \int v dx - \int \frac{du}{dx} (\int v dx) dx$$

$$\int \sqrt{x} \ln x \sqrt{x} = \ln(x) \frac{2}{3} (x^{\frac{3}{2}}) \frac{1}{3} \int \sqrt{x} dx$$

$$\Rightarrow \int \sqrt{x} \ln x \sqrt{x} = \frac{1}{3} x^{\frac{3}{2}} \ln(x) - \frac{2}{9} x^{\frac{3}{2}} + c$$

$$\Rightarrow \int \sqrt{x} \ln x \sqrt{x} = \frac{1}{9} x^{\frac{3}{2}} (3 \ln(x) - 2) + c \quad [\text{answer}]$$

$$2 \quad \text{Use reduction formula to evaluate:} \quad \int_0^{\frac{\pi}{2}} \cos^6(x) dx$$

According to reduction formula we know that,

$$\int \cos^n(x) dx = \frac{1}{n} \cos^{n-1}(x) \sin(x) + \frac{n-1}{n} \int \cos^{n-2}(x) dx$$

$$\Rightarrow \int_0^{\frac{\pi}{2}} \cos^6(x) dx = \frac{1}{6} \int_0^{\frac{\pi}{2}} \cos^{6-1}(x) \sin x + \frac{6-1}{6} \int_0^{\frac{\pi}{2}} \cos^{6-2}(x) dx$$

$$\Rightarrow \int_0^{\frac{\pi}{2}} \cos^6(x) dx = \left[ \frac{1}{6} \cos^5 x \sin x \right]_0^{\frac{\pi}{2}} + \frac{5}{6} \int_0^{\frac{\pi}{2}} \cos^4 x dx$$

$$\Rightarrow \int_0^{\frac{\pi}{2}} \cos^6(x) dx = 0 + \frac{5}{6} \int_0^{\frac{\pi}{2}} \cos^4(x) dx \quad \left[ \because \frac{1}{6} \cos^5\left(\frac{\pi}{2}\right) \sin\left(\frac{\pi}{2}\right) - \frac{1}{6} \cos^5(0) \sin(0) = 0 \right]$$

$$\Rightarrow \int_0^{\frac{\pi}{2}} \cos^6(x) dx = \frac{5}{6} \left( \frac{1}{4} \cos^{4-1} x \sin x + \frac{4-1}{4} \int_0^{\frac{\pi}{2}} \cos^{4-2} x dx \right) \quad \left[ \because \text{applying reduction method} \right]$$

$$\Rightarrow \int_0^{\frac{\pi}{2}} \cos^6(x) dx = \left[ \frac{5}{24} \cos^3 x \sin x \right]_0^{\frac{\pi}{2}} + \frac{5}{8} \int_0^{\frac{\pi}{2}} \cos^2 x dx$$

$$\Rightarrow \int_0^{\frac{\pi}{2}} \cos^6(x) dx = 0 + \frac{5}{8} \int_0^{\frac{\pi}{2}} \cos^2(x) dx \quad \left[ \because \frac{5}{24} \cos^3\left(\frac{\pi}{2}\right) \sin\left(\frac{\pi}{2}\right) - \frac{5}{24} \cos^3(0) \sin(0) = 0 \right]$$

$$\Rightarrow \int_0^{\frac{\pi}{2}} \cos^6(x) dx = \frac{5}{8} \int_0^{\frac{\pi}{2}} \cos(2x) + \frac{1}{2} \int_0^{\frac{\pi}{2}}$$

let,

$$u = \cos 2x$$

$$u = 2x$$

$$\therefore u = 2x \, dx$$

So, we get a new lower bound from here,

$$u = 2 \times 0$$

$$= 0$$

and in upper bound

$$u = 2 \times \frac{\pi}{2}$$

$$= \pi$$

Applying fundamental theorem of calculus

$$\left[ \frac{5 \sin(u)}{32} \right]_0^\pi = \frac{5 \sin(\pi)}{32} - \frac{5 \sin(0)}{32}$$
$$\left[ \frac{5 \sin(u)}{32} \right]_0^\pi = 0$$

So, we get

$$\Rightarrow \int_0^{\frac{\pi}{2}} \cos^6(x) \, dx = \frac{5}{16} \int_0^{\frac{\pi}{2}} 1 \, dx$$

$$\Rightarrow \int_0^{\frac{\pi}{2}} \cos^6(x) \, dx = \left[ \frac{5x}{16} \right]_0^{\frac{\pi}{2}}$$

$$\Rightarrow \int_0^{\frac{\pi}{2}} \cos^6(x) \, dx = \frac{5\pi}{32} - \frac{5 \times 0}{32}$$

$$\Rightarrow \int_0^{\frac{\pi}{2}} \cos^6(x) \, dx = \frac{5\pi}{32} \quad [answer]$$

3 Evaluate the integral using appropriate substitution:

$$\int \frac{\cos 4\theta}{1+2\sin 4\theta} d\theta$$

let,

$$u = 4\theta$$

$$du = 4 d\theta$$

So, we get

$$\frac{1}{4} \int \frac{\cos(u)}{1+2\sin(u)} du$$

$$y = 2\sin(u) + 1$$

$$dy = 2\cos(u) du$$

$$\frac{1}{8} \int \frac{1}{y} dy$$

$$= \frac{1}{8} \times \log(y) + c$$

$$= \frac{1}{8} \log(2\sin(u) + 1) + c$$

$$= \frac{1}{8} \log(2\sin(4\theta) + 1) + c \quad [answer]$$

4 Use Gamma Function to evaluate  $\int_0^\infty x^5 e^{-x^2} dx$

let,

$$x^2 = u$$

$$\Rightarrow \frac{d}{dx}(x^2) = \frac{d}{dx}(u)$$

$$\Rightarrow 2x = \frac{du}{dx}$$

$$\Rightarrow x dx = \frac{du}{2}$$

$$\therefore dx = \frac{du}{2x} = \frac{du}{2\sqrt{u}}$$

So,

$$\int_0^\infty x^5 e^{-x^2} dx = \int_0^\infty (\sqrt{u})^5 \cdot e^{-u} \cdot \frac{du}{2\sqrt{u}}$$

$$\int_0^\infty x^5 e^{-x^2} dx = \int_0^\infty u^{\frac{5}{2}} \cdot e^{-u} \cdot \frac{du}{2 u^{-\frac{1}{2}}}$$

$$\int_0^\infty x^5 e^{-x^2} dx = \frac{1}{2} \int_0^\infty e^{-u} \cdot u^{\frac{5-1}{2}} du$$

$$\int_0^\infty x^5 e^{-x^2} dx = \frac{1}{2} \int_0^\infty e^{-u} \cdot u^2 du$$

$$\int_0^\infty x^5 e^{-x^2} dx = \frac{1}{2} \int_0^\infty e^{-u} \cdot u^{3-1} du$$

$$\int_0^\infty x^5 e^{-x^2} dx = \frac{1}{2} \times \Gamma 3 \quad \left[ \because \int_0^\infty e^{-u} u^{n-1} du = \Gamma n \right]$$

$$\int_0^\infty x^5 e^{-x^2} dx = \frac{1}{2} \times 2!$$

$$\int_0^\infty x^5 e^{-x^2} dx = 1 \quad [answer]$$

- 5 Prove the Fundamental theorem of Calculus (It cannot be an exact copy from any source. You can use references but it should be properly cited. Also, you cannot copy paste directly. In that case you won't receive any marks).

According to Fundamental Theorem of Calculus we know that, if there is a graph which occupies a place say, A under the graph of f which is continuous [a,b] and F is an anti derivative of f, then

$$\int_a^b f(x)dx = F(b) - F(a)$$

Let, we are given an function  $f(t)$   
define the function  $F(x)$  –

$$F(x) = \int_a^x f(t)dt$$

Say,  $x_1$  and  $\Delta x$  are two values between  $[a + b]$

So, we get,

$$F(x_1) = \int_a^{x_1} f(t) dt;$$

and

$$F(x_1 + \Delta x) = \int_a^{x_1 + \Delta x} f(t)dt$$

If we subtract, then we get,

$$\int_a^{x_1 + \Delta x} f(t)dt - \int_a^{x_1} f(t)dt = \int_{x_1}^{x_1 + \Delta x} f(t)dt$$

$$F(x_1 + \Delta x) - F(x_1) = \int_{x_1}^{x_1 + \Delta x} f(t)dt$$

According to mean value theorem,

A real number exists between  $r \in [x_1, x_1 + \Delta]$

$$\int_{x_1}^{x_1 + \Delta x} f(t)dt = f(r) \cdot \Delta x$$

$$F(x_1 + \Delta x) - F(x_1) = f(r) \cdot \Delta x$$

$$\frac{F(x_1 + \Delta x) - F(x_1)}{\Delta x} = f(r) \cdot \Delta x$$

$$\lim_{\Delta x \rightarrow 0} \frac{F(x_1 + \Delta x) - F(x_1)}{\Delta x} = \lim_{\Delta x \rightarrow 0} f(r)$$

$$F'(x_1) = \lim_{\Delta x \rightarrow 0} f(r) \quad \left[ \because \lim_{\Delta x \rightarrow 0} \frac{F(x_1 + \Delta x) - F(x_1)}{\Delta x} = F'(x_1) \right]$$

$$\begin{aligned}
&\text{So, } \lim_{\Delta x \rightarrow 0} x_1 = x_1 \\
&\text{and } \lim_{\Delta x \rightarrow 0} x_1 + \Delta x = x_1 \\
&\therefore \lim_{\Delta x \rightarrow 0} r = x_1
\end{aligned}$$

We can now say that,  $f$  is continuous at  $r$ ,  
 $\therefore F'(x_1) = f(x_1)$

[proved]

6 You are asked to integrate the following definite integrals,  
 $\int_0^{2\pi} \sin x \, dx$

$$\begin{aligned}
&(a) \\
&\int_0^{2\pi} \sin x \, dx = [-\cos x]_0^{2\pi} \\
&= -[\cos x]_0^{2\pi} \\
&= -[\cos 2\pi - \cos(0)] \\
&= -(1 - 1) \\
&= 0
\end{aligned}$$

*According to Fundamental Theorem of Calculus we know that we will get an area after integration and area has a space which is obviously greater than zero.*

$$\begin{aligned}
& (b) \\
\int_0^{2\pi} |\sin x| \, dx &= \int_0^{\pi} + \sin x \, dx + \int_{\pi}^{2\pi} - \sin x \, dx && [\text{plotting the value in graph}] \\
&= \int_0^{\pi} \sin x \, dx - \int_{\pi}^{2\pi} + \sin x \, dx \\
&= [-\cos x]_0^{\pi} - [-\cos x]_{\pi}^{2\pi} \\
&= -[\cos x]_0^{\pi} - [-\cos x]_{\pi}^{2\pi} \\
&= -[\cos \pi \cos 0]_0^{\pi} - [-\cos 2\pi - \cos \pi]_{\pi}^{2\pi} \\
&= -[-1 - 1] + [1 - (-1)] \\
&= 2 + 2 \\
&= 4 \\
& \qquad \qquad \qquad [\text{answer}]
\end{aligned}$$
